

MILESTONE:3

Week 5: Cohort & Segment Analysis – Report

1. Overview:

The Week 5 analysis focuses on identifying key cohorts and user segments by examining patterns across demographics and device usage to understand how different groups contribute to overall performance. This analysis helps highlight which user categories drive the highest engagement and which segments show weaker participation, allowing for clearer insight into areas that need improvement. By studying variations across age groups, device types, and locations, the report identifies the strongest-performing cohorts and uncovers opportunities to enhance engagement among underperforming segment

2. Cohort Identification:

Top cohorts identified include:

- Age Band 18–25 using Mobile Devices – Highest engagement and consistent activity.
- Age Band 26–35 using Laptops/Tablets – Strong productivity-related usage.
- Urban location users – Higher participation and feature diversity.

3. Segment Comparison Insights:

Heatmap insights show:

- Young age groups (18–25, 26–35) on mobile have the highest engagement.
- Older cohorts (40+) and desktop users show reduced activity.
- Peak usage appears in evening time windows.

4. Behavioral Insights by Segments:

By Age:

- 18–25: Highest usage frequency.

- 26–35: Stable usage patterns.
- 36–45+: Lower adoption.

By Device:

- Mobile users dominate overall screen time.
- Laptop/Tablet users focus on productivity features.
- Desktop usage minimal.

By Location:

- Urban users: High consistency and screen-time intensity.
- Rural/semi-urban: Lower usage rates.

5. Drivers Behind Performance

High Engagement Drivers:

- Mobile device convenience
- Strong digital habits of younger users
- Better connectivity in urban zones

Low Engagement Drivers:

- Device limitations among desktop-only users
- Low digital adoption in older age groups

6. Key Takeaways:

- Mobile-first younger cohorts are the primary contributors.
- Urban segments show strong and stable engagement.
- Desktop users and older age groups require targeted strategies.
- Cohort insights can support personalized interventions and engagement plans.

Data visualization:

Conclusion:

The Week 5 cohort and segment analysis reveals that younger, mobile-first users form the strongest and most consistent contributors to overall performance, demonstrating high engagement and stable usage patterns. Urban users also show significantly better screen-time intensity and feature adoption compared to rural and semi-urban segments. In contrast, older age groups and desktop-dependent users exhibit lower engagement and irregular activity, highlighting areas that require focused improvement strategies. Overall, the insights emphasize the importance of targeting high-value cohorts while designing interventions to uplift weaker segments, enabling more balanced and effective user engagement across all groups.
